4) Can I titrate a solution of unknown concentration with another solution of unknown concentration and still get a meaningful answer? Explain your answer in a few sentences.
Titration cannot be done without molality of at least one of the substances. In order to solve. $M_{1} V_{1}=M_{2} V_{2}$, both molarities cannot be unknown.
5) Explain the difference between an endpoint and equivalence point in a titration.

Endpoint: titration can be stopped.
Equivalence point: when $\left[\mathrm{H}^{+}\right]$and $\left[\mathrm{OH}^{-}\right]$are neutralized.
The effectiveness of a titration is measured by the closeness of the end point to the equivalence point.
